Service Manual Air Conditioner

CS-MC12DKV CU-2C24DKV

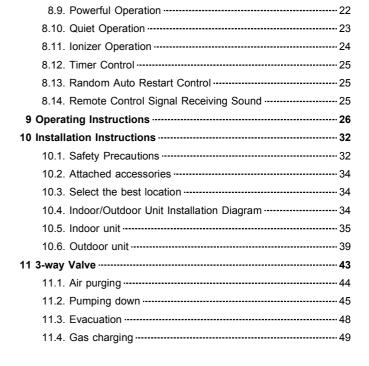

This service information is designed for experienced repair technicians only and is not designed for use by the general public. It does not contain warnings or cautions to advise non-technical individuals of potential dangers in attempting to service a product. Products powered by electricity should be serviced or repaired only by experienced professional technicians. Any attempt to service or repair the product or products dealt with in this service information by anyone else could result in serious injury or death.

1 Features

- High Efficiency
- Compact Design
- Wider range of horizontal discharge air
- Air Filter with function to reduce dust and smoke
- Automatic air swing and manual adjusted by Remote Control for vertical airflow.
- Long Installation Piping
 - Long piping up to 15 meter

• Quality Improvement

- Random auto restart after power failure for safety restart operation
- Gas leakage protection
- Prevent compressor reverse cycle
- Inner protector to protect compressor
- Noise prevention during soft dry operation.
- Gold Coated Condenser for high resistance to corrosion

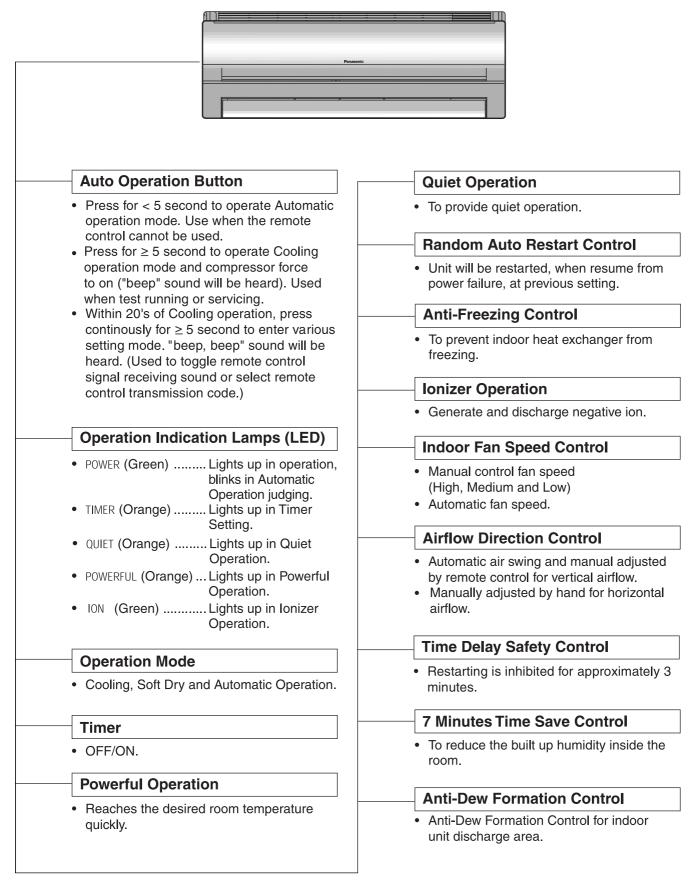

• Operation Improvement

- Quiet mode to provide extra quiet operation
- Powerful mode to reach the desired room temperature quickly
- Ionizer control for generating negative ion in discharge air.
- 24-hour timer setting
- Serviceability Improvement
 - Removable and washable Front Panel

8 Operation Details

8.1. Cooling Operation

- Cooling operation can be set using remote control.
- This operation is applied to cool down the room temperature reaches the setting temperature set on the remote control.
- The remote control setting temperature, which takes the reading of intake air temperature sensor, can be adjusted from 16°C to 30°C.
- During cooling operation, the compressor will stop running and restart as shown in below figure.

8.1.1. Cooling Operation Time Diagram

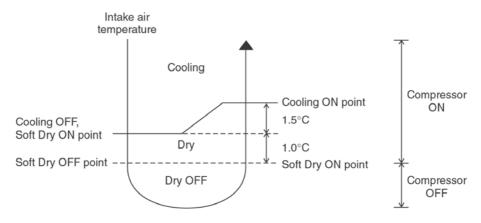

<Description of operation>

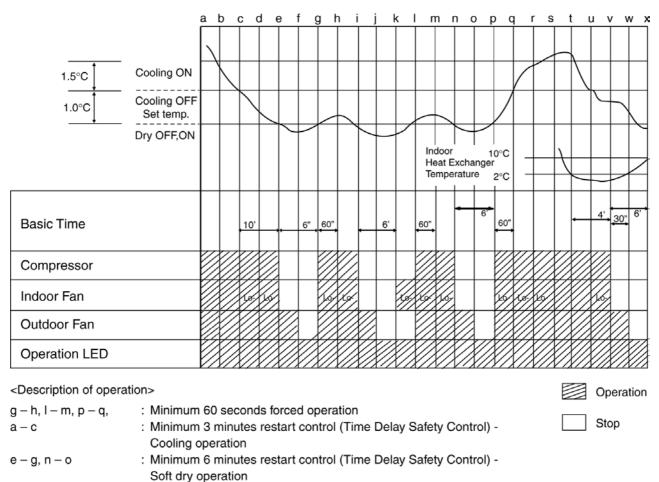

a – b, g – h	: Minimum 60 seconds forced operation	Operation
d – g, s – u	: Minimum 3 minutes restart control (Time Delay Safety Control)	Stop
h – o	: Maximum 7 minutes time save control	Stop
q — u	: Anti-Freezing Control	

8.2. Soft Dry Operation

- Soft Dry operation can be set using remote control.
- Soft Dry operation is applied to dehumidify and to perform a gentle cooling to the room.
- This operation starts when the intake air temperature sensor reaches the setting temperature on the remote control.
- When operation begins, Soft Dry will be switched "ON" for a maximum 10 minutes, then Soft Dry operation will be turned "OFF" for a minimum 6 minutes. After that, the Soft Dry operation will be "ON" and "OFF" based on the setting temperature as shown in below figure.
- However after 3 minutes of compressor off, during Soft Dry "OFF" (within 6 minutes Soft Dry restart control), the indoor unit will start to operate at normal Cooling mode if the intake temperature is higher than Cooling "ON" point.

8.2.1. Soft Dry Operation Time Diagram

t - x : Anti-Freezing Control

8.3. Automatic Operation

- Automatic operation can be set using remote control.
- This operation starts to operate with indoor fan at SLo speed for 20 seconds to judge the intake air temperature.
- After judged the temperature, the operation mode is determined by referring to the below standard.

Intake Air	↑ 23°C	Cooling Operation
Temperature	23 0	Soft Dry Operation

• Then, the unit start to operate at determined operation mode, until it is switched off using remote control, with the setting temperature as shown in below table.

	Setting Temperature (Standard)
Cooling Operation	25°C
Soft Dry Operation	22°C

• The setting temperature for all the operations can be changed one level up or one level down from the standard temperature as shown in below table by pressing on the temperature up or temperature down button at remote control.

			Cooling	Soft Dry
Higher	→	+2°C	27°C	24°C
Standard	→	±0°C	25°C	22°C
Lower	→	–2°C	23°C	20°C

• The operation mode judging temperature and standard setting temperature can be increased by 2°C permanently, by open the circuit of JX1 at indoor electronic controller.

Intake Air	↑ 25°C	Cooling Operation
Temperature	25 €	Soft Dry Operation

	Setting Temperature (Standard)
Cooling Operation	27°C
Soft Dry Operation	24°C

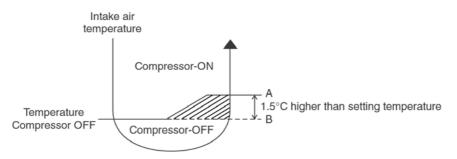

8.4. Operation Control

8.4.1. Restart Control (Time Delay Safety Control)

- When the thermo-off temperature (temperature which compressor stops to operate) is reached during:-
 - Cooling/Heating operation the compressor stops for 3 minutes (minimum) before resume operation.
 - Soft Dry operation the compressor stops for 6 minutes (minimum) before resume operation.
- If the operation is stopped by the remote control, the compressor will not turn on within 3 minutes from the moment operation stop, although the unit is turn on again within the period.
- This phenomenon is to balance the pressure inside the refrigerant cycle.

8.4.2. 7 Minutes Time Save Control

- The compressor will start automatically if it has stopped for 7 minutes and the intake air temperature falls between the compressor ON temperature (A) and compressor OFF temperature (B) during the period.
- This phenomenon is to reduce the built up humidity inside a room.

8.4.3. 60 Seconds Forced Operation

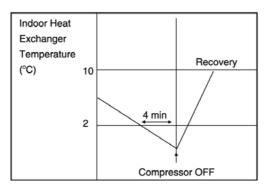

- Once the air conditioner is turned on, the compressor will not stop within 60 seconds in a normal operation although the intake air temperature has reached the thermo-off temperature. However, force stop by pressing the OFF/ON operation button at the remote control is permitted.
- The reason for the compressor to force operate at minimum 60 seconds is to allow the refrigerant oil run in a full cycle and return back to the outdoor unit.

8.4.4. Starting Current Control

- When the compressor, outdoor fan motor and indoor fan motor are simultaneously started, the indoor fan motor will start to operate at 1.6 second later.
- \bullet The reason of the difference is to reduce the starting current flow.

8.4.5. Anti-Freezing Control

- If the temperature of the indoor heat exchanger falls below 2°C continuously for 4 minutes or more, the compressor turns off. The fan speed setting remains the same.
- This phenomenon is to protect the indoor heat exchanger from freezing and to prevent higher volume of refrigerant in liquid form returning to the compressor.
- Compressor will restart again when the indoor heat exchanger temperature rises to 10°C (Recovery).
- Restart control (Time Delay Safety Control) will be applied in this Control if the recovery time is too short.

8.4.6. Compressor Reverse Rotation Protection Control

- If the compressor is operating continuously for 5 minutes or longer and the temperature difference between intake air and indoor heat exchanger is 2.5°C or less for continuous 2 minutes, compressor will stop and restart automatically.
- Time Delay Safety Control is activated before the compressor restart.

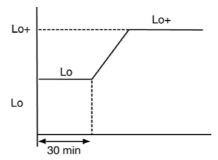

- s T = Intake air temperature Indoor heat exchanger temperature
- This is to prevent compressor from rotate reversely when there is an instantaneous power failure.

8.4.7. Anti-Dew Formation Control

- Purpose is to prevent dew formation on indoor unit discharge area.
- When room temperature is constant (±1°C) the following condition occur for 30 minutes continuously, anti-dew formation will activate:
 - Indoor intake temperature is more than 24°C and less than 30°C.
 - Remote Control setting temperature is less than 25°C.
 - Compressor is on.
 - Cooling Operation Mode.
 - Indoor fan motor operate at Low fan speed or QLo.

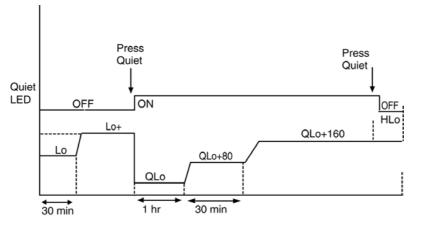

- Anti-Dew Formation is control by:-
- Increasing Air Flow Volume
 - 1. Lo fan speed.

Lo fan speed is changed to Lo+ after 30 min to prevent dew formation.

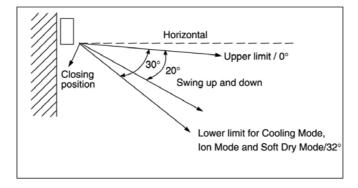

2. QLo fan speed.

Dew formation may occur at QLo cool, therefore QLo cool is operated only 1hr 30min (1 hr QLo, 30 min QLo + 80 rpm). After that, it operates at QLo + 160 rpm (However Quiet LED remains on).

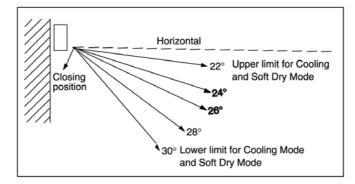

- Narrowing
 - 1. Vertical Airflow Direction

During Anti-Dew condensation prevention, Airflow Direction Auto-control angle from 0° - 32° to 20° - 30° under cooling and Soft Dry operation mode.

During Anti-Dew condensation prevention, Airflow Direction Manual Control angle change from 10°, 15°, 20°, 26°, 32° to 22°, 24°, 26°, 28°, 30°.

8.5. Indoor Fan Speed Control

• Indoor Fan Speed can be set using remote control.

8.5.1. Fan Speed Rotation Chart

Speed	Fan Speed (rpm)
	CS-MC12DKV
S Hi	1300
Hi	1270
Me	1050
H Lo	980
C Lo	920
Lo-	840
S Lo	790
SS Lo	-
Q S Hi	-
Q Hi	1170
Q Me	950
QH Lo	-
Q Lo	820

8.5.2. Automatic Fan Speed Control

• When set to Auto Fan Speed, the fan speed is adjusted between maximum and minimum setting as shown in the table.

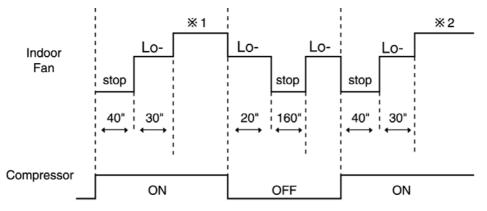

- Fan speed rotates in the range of Hi and Me.
- Deodorizing Control will be activated.

Speed Mode			S Hi	Hi	Me	H Lo	C Lo	Lo-	S Lo	SSLo	Stop	
			Hi		0							
_		Manual	Me			0						
Cooling	Normal		Lo					0				
8		Auto			0	0			0			0
	Powerful	Manual		0								
	Fowenu	Auto		0								
Soft Dry		Manual							0			0
йŌ		Auto	Auto						0			0
Mode j	udgement									0		
			Q Hi		Hi-100							
Cooling	Quiet	Manual	Q Me			Me-100						
8	Quiet		Q Lo					CLo-100				
		Auto	Auto		Hi-100	Me-100			0			0
Soft Dry	Quiet	Manual						CLo-100	0			0
٥D	Galet	Auto						CLo-100	0			0
Ion onl	у	Manual			0	0		0				0
Auto					0	0				0		

• Auto Fan Speed during cooling operation:

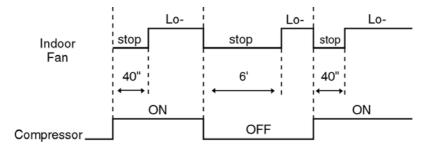

1. Indoor fan will rotate alternately between off and on as shown in below diagram.

- 2. At the beginning of each compressor start operation, indoor fan will increase fan speed gradually for deodorizing purpose.
- 3. For the first time the compressor operate, indoor fan will be switched to Hi fan speed from Lo- after 70 seconds from the start of compressor. This cause the room temperature to achieve the setting temperature quickly.
- 4. During compressor stop, indoor fan will operate at Lo for the beginning 20 seconds to prevent higher volume of refrigerant in liquid form returning to the compressor.
- 5. After the compressor at turn off condition for 3 minutes, indoor fan will start to operate at Lo- to circulate the air in the room. This is to obtain the actual reading of the intake air temperature.
- 6. For the resume of compressor operation, indoor fan will operate at Me fan speed to provide comfort and lesser noise environment, after 70 seconds from the restart of compressor.

- * 1 Fan Speed is Hi until the compressor stops (when the room temperature reaches setting temperature).
- ※ 2 Fan Speed is Me after the compressor restarts.

- Auto Fan Speed during Soft Dry operation:
 - 1. Indoor fan will rotate alternately between off and Lo-.
 - 2. At the beginning of each compressor start operation, indoor fan will increase fan speed gradually for deodorizing purpose.
 - 3. When compressor at turn off condition for 6 minutes, indoor fan will start fan speed at Lo- to circulate the air in the room. This is to obtain the actual reading of intake air temperature.

8.5.3. Manual Fan Speed Control

- Manual fan speed adjustment can be carried out by using the Fan Speed selection button at the remote control.
- There are 3 types of fan speed settings: Lo, Me, Hi.

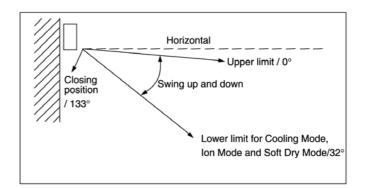

8.6. Outdoor Fan Speed Control

- There is only one speed for outdoor fan motor.
- When the air conditioner is turned on, the compressor and the outdoor fan will operate simultaneously.
- Likewise, both compressor and outdoor fan will stop at the same time if the unit is turned off.

8.7. Vertical Airflow Direction Control

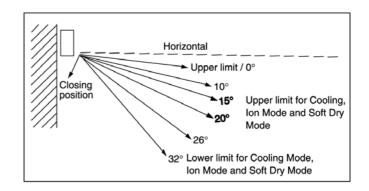

8.7.1. Auto Control

- When the vertical airflow direction is set to Auto using the remote control, the louver swings up and down as shown in the diagram.
- When stop operation using the remote control, the discharge vent is reset, and stop at the closing position.
- During Cooling operation or Soft Dry operation, indoor fan motor may stop to rotate at certain periods. At that condition, the louver will stop swinging and rest at the upper limit.

8.7.2. Manual Control

- When the vertical airflow direction is set to Manual using the remote control, the automatic airflow is released and the airflow direction louver move up and down in the range shown in the diagram.
- The louver can be adjusted by pressing the button to the desired louver position.
- When stop operation using the remote control, the discharge vent is reset, and stop at the closing position.

8.8. Horizontal Airflow Direction Control

• The horizontal airflow direction louvers can be adjusted manually by hand.

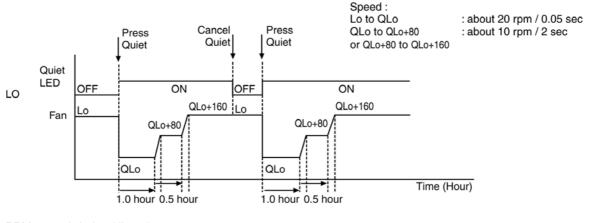

8.9. Powerful Operation

- The Powerful operation is to achieve the setting temperature quickly.
- When Powerful operation is set, the setting temperature will be automatically decreased 3°C internally against the present setting temperature (Lower temperature limit: 16°C).
- This operation automatically will be running under SHi Fan Speed (Cooling), Lo- Fan Speed (Soft Dry).
- Vertical Airflow Direction:-
- In "Manual" setting, the vane will automatically shift down 10° lower than previous.
- In "Auto" setting, the vane will automatically swing up and down. However the lower limit will be shifted 10° downward.
- Powerful Mode will operate for 15 minutes only and operation will shift back to previous setting mode.
- · Powerful operation stops when:-
 - Powerful mode button is pressed again.
- Stopped by OFF/ON operation button.
- Timer OFF activates.
- Quiet mode button is pressed.
- Operation mode button is changed.

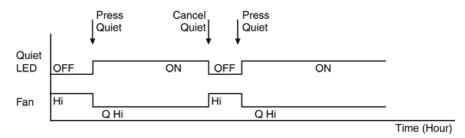

8.10. Quiet Operation

(For Cooling Operation or cooling region of Soft Dry Operation)

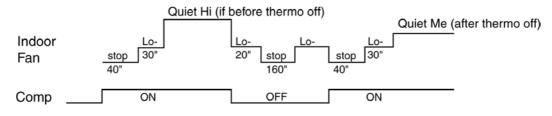

- The Quiet operation is to provide quiet/cooling operation condition compare to normal operation.
- Once the Quiet Mode is set at the remote control, the Quiet Mode LED illuminated. The sound level will reduce around 2 dB(A) for Lo fan speed or 3 dB(A) for Hi/Me fan speed against the present operation sound level.
- Dew formation become severe at Quiet Lo cool, therefore Quiet Lo cool is operated only 1hr 30 min (1hr QLo, 30 min QLo + 80 rpm). After that, it goes back to Lo cool (However Quiet LED remains on).
- Manual Airflow Direction:-
 - RPM control during Lo cool

- RPM control during Hi cool

• Auto Airflow Direction:-

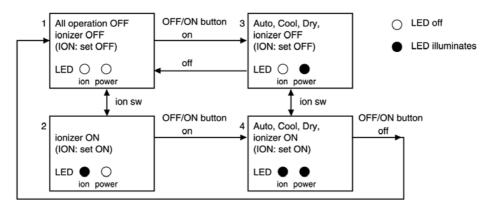

- Quiet operation stops when:-
 - Quiet button is pressed again.
 - Stopped by OFF/ON operation button.
 - Timer OFF activates.
 - Powerful button is pressed.
 - Operation mode button is changed.

8.11. Ionizer Operation

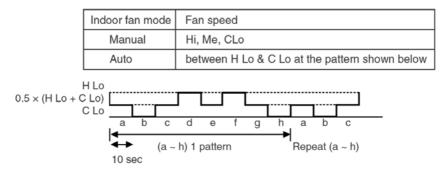

• The lonizer operation is to provide fresh air effect to user by producing minus ion in discharge air.

8.11.1. Operation Control

1. Ionizer individual operation

- a. When air-conditioner unit is at "OFF" condition (standby) and ION operation button at the remote control is pressed, the lonizer operation will turn on. Only ION LED will illuminates. Power LED maintain off. $(1 \rightarrow 2)$
- b. Ionizer individual operation can be turned off by pressing the ION button again. (2 \rightarrow 1)
- c. Fan speed can be adjusted later by customer during this operation.

- d. Vertical airflow direction can be adjusted using remote control during lonizer individual operation.
- e. During Ionizer individual operation, operated mode (Auto, Cool, Dry) can be activated by turning on the OFF/ON operation button. $(2 \rightarrow 4)$
- f. If power failure occur during lonizer individual operation, after power resume, lonizer operation will be activated immediately.
- g. When the Ionizer circuit feedback process error occur for 24 times (about 11hr 30 min.), Ionizer operation will turn off with ION LED blinks continuously.

(For details, please refer to lonizer Error detection control)

2. Operation mode & Ionizer operation.

- a. When air-conditioner unit is at "ON" condition and ION operation button at the remote control is pressed, the lonizer operation will turn on. ION & Power LED will illuminate. $(3 \rightarrow 4)$
- b. lonizer operation stops when:
 - ION operation button is press again.
 - Stopped by OFF/ON operation button.
 - Timer OFF activates.
 - Ionizer circuit feedback signal shows error.
- c. Ionizer operation status is not memorised when the air conditioner has been switched off. The air-conditioner will operate without ionizer operation when it is turned on again. However, if power failure occurs during lonizer operation together with Cooling operation, air-conditioner will start to operate at Cooling operation with Ionizer operation when the power is resumed.

8.11.2. Error Detection Control

- The error detection control is to inform user that error occurs at ionizer system and repairing job will be needed.
- There are two types of error detection control:
- a. When Ionizer is ON
 - If ionizer feedback = Lo for 24 times within 11hr 30min, ION LED blinks continuously.
- b. When ionizer is OFF
- If ionizer feedback = Hi, ION LED blinks continuously.
- During ionizer at breakdown condition, if ionizer feedback voltage = Lo (become normal), ION LED will stop blinking.
- The error detection control can be reset by:
 - i) Pressing the OFF/ON operation button to switch the operation OFF.
 - ii) Pressing the Auto Operation button to force the operation OFF.
 - iii) Setting the OFF Timer to stop the operation (Not applicable when ionizer is OFF).

8.12. Timer Control

- There are 2 types of timer, ON and OFF timer.
- Both ON and OFF timer can be set by pressing ON or OFF button respectively.
- By pressing ON/OFF operation button, ON Timer or OFF Timer will not be cancelled.
- To cancel the previous timer setting, press CANCEL button.
- To activate the previous timer setting, press SET button once again.
- If main power supply is switched off, the timer setting will be cancelled.

8.12.1. ON Timer

- When ON Timer is set by using the remote control, the unit will start to operate slightly before the set time, so that the room will reach nearly to the set temperature by the set time.
- For Cooling and Soft Dry operation, the operation will start 15 minutes before the set time.
- For Automatic operation, the indoor fan will operate at SLo speed for 25 seconds, 30 minutes before the set time to detect the intake air temperature to determine the operation mode. The operation indication lamp will blink at this time.

8.12.2. OFF Timer

• When OFF Timer is set by using the remote control, the unit will stop operate according to the desired setting.

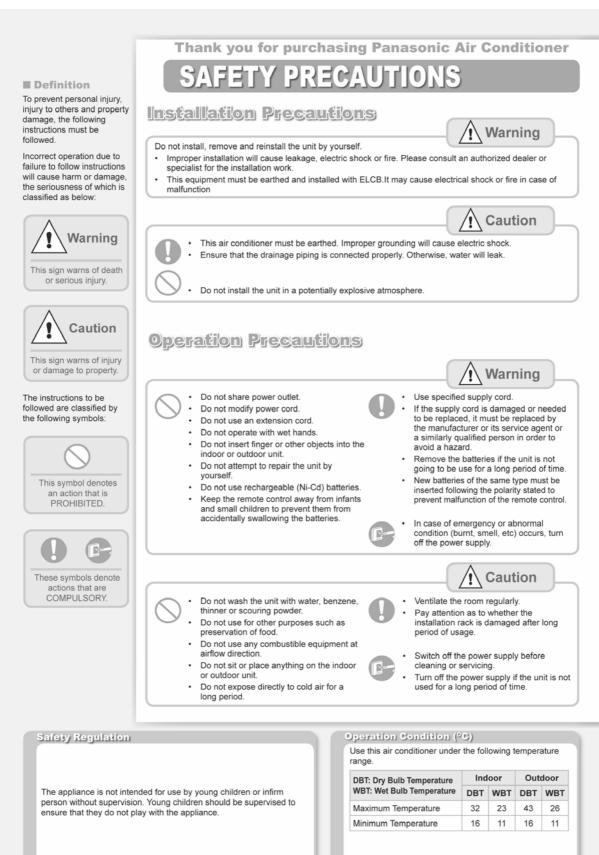

8.13. Random Auto Restart Control

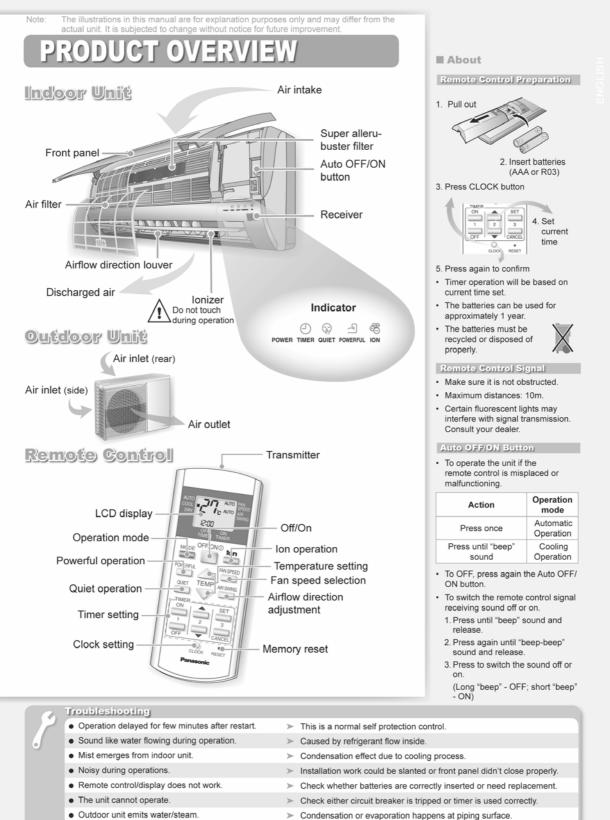

- If there is a power failure during operation, the air conditioner will automatically restart after 3 to 4 minutes when the power is resumed.
- It will start with previous operation mode and airflow direction.
- If there are more than one air conditioner unit in operation and power failure occur, restart time for each unit to operate will be decided randomly using 4 parameters:- intake air temperature, setting temperature, fan speed and air swing louver position.
- This Random Auto Restart Control is not available when Timer is set.
- This control can be omitted by open the circuit of JX2. (Refer Circuit Diagram)(Indoor PCB)

8.14. Remote Control Signal Receiving Sound

- · Long beep sound will be heard when:-
 - Stopping the air conditioner using ON/OFF switch.
 - Stopping the Quiet Mode.
 - Stopping the Powerful Mode.
 - Stopping the Ion Mode.
- Short beep sound will be heard for others setting.

9 Operating Instructions

- > Condensation or evaporation happens at piping surface.

Operation Details

AUTO - Automatic Operation

- · The unit will automatically select the operation mode according to the room temperature.
- · Once the operation mode is selected, the unit will operate at the standard setting temperature as shown:

Room temperature	Operation mode	Standard setting temperature
23°C & above	Cool	25°C
Below 23°C	Dry	22°C

 You may press or button to change the standard setting temperature to "HI" or "LO" as shown:

н	LO
27°C	23°C
24°C	20°C
	27°C

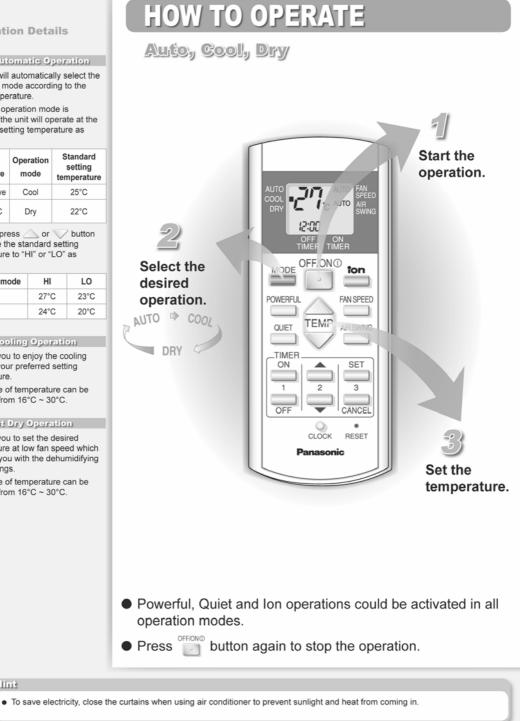

COOL - Cooling Operation

- · Enables you to enjoy the cooling effect at your preferred setting temperature.
- · The range of temperature can be selected from 16°C ~ 30°C.

DRY - Soft Dry Operation

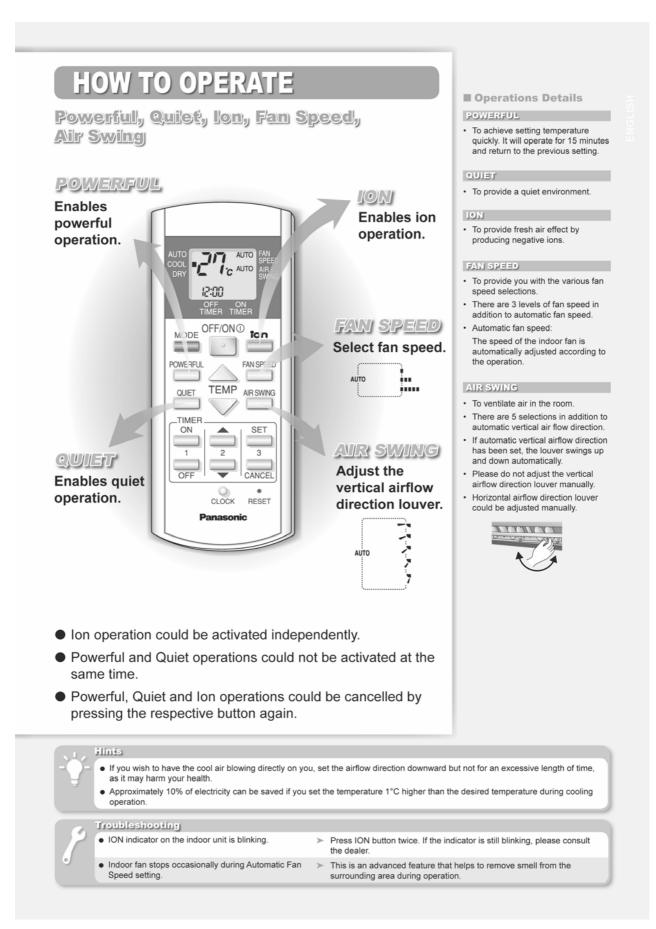

- · Enables you to set the desired temperature at low fan speed which provides you with the dehumidifying surroundings.
- · The range of temperature can be selected from 16°C ~ 30°C.

Hint

Troubleshooting The room has a peculiar odour.

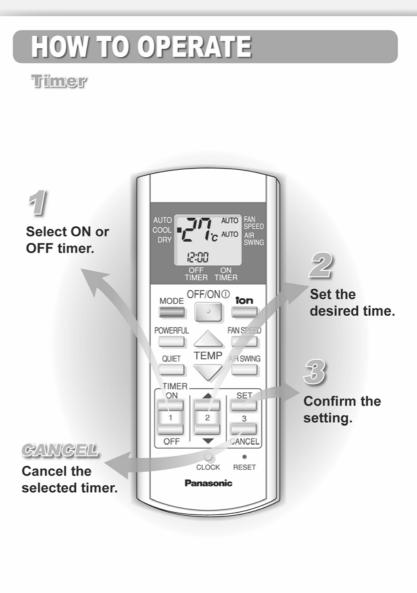

- Air conditioner does not cool efficiently.
- > This may be a damp smell emitted by the wall, carpet, furniture or clothing in the room.
- Ensure the temperature has been set correctly
 - Ensure windows and doors have been closed properly. Ensure filters are cleaned or replaced when necessary.
- > Ensure inlet and outlet vents of the units have not been obstructed.

Operation Details

TIMER

- · Use the ON timer to turn on the air conditioner at the desired time. This will give you a cooling environment, e.g. when you return from work or wake up.
- · When the ON timer is set, operation will start 15 minutes before the actual set time.
- · Use the OFF timer to stop the air conditioner operation at the desired time. This can save electricity while you are going out or sleeping.
- · The set timer will repeat daily once it is set.
- · If there is a power failure, you can press SET button to restore the previous setting once the power is resumed.
- · If the timer is cancelled, you can restore the previous setting by pressing SET button.

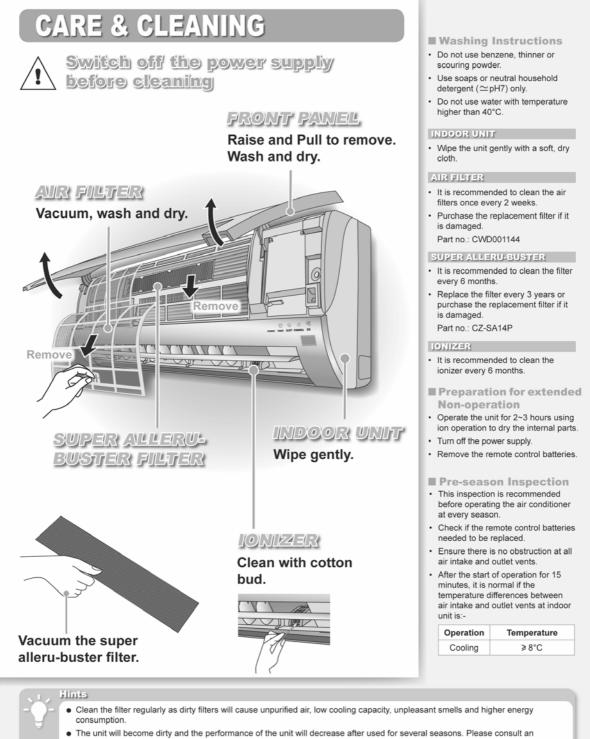

- Ensure the clock on the remote control has been set correctly.
- You could use the ON and OFF timers at the same time.
- To cancel either the ON or OFF timer, press $\stackrel{\circ N}{\longrightarrow}$ or $\stackrel{\circ}{\longrightarrow}$ then press _____.

Filine

• Press CLOCK more than 10 seconds to change the time format from 24 hours to AM/PM format. • For your convenience, you could set the air conditioner to operate automatically by using both ON and OFF timer.

Troubleshooting

- TIMER indicator always on.
- > Timer is activated and the setting will repeat itself daily.
- POWER indicator is blinking 15 minutes before ON timer is activated.
 - \succ The unit is determining the operation mode by sensing the room temperature. This happens when it has been set to AUTO operation mode.

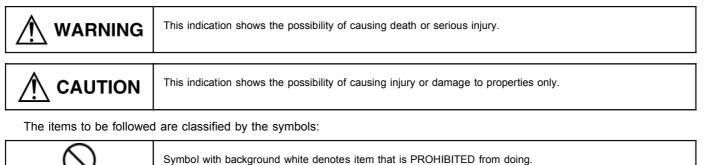

- The same win become unity and the performance of the unit win decrease anter used for several seasons. Please consult an authorized dealer to perform seasonal inspections in addition to regular cleaning.
 This air conditioner is equipped with a built in surge protective device. However, in order to further protect your circle additioned in the surger of the surger in order to further protect your circle additioned in the surger of the
- This air conditioner is equipped with a built-in surge protective device. However, in order to further protect your air conditioner from being damaged by abnormally strong lightning activity, you may switch off the power supply.

10 Installation Instructions

	Required tools for Installation Works							
1.	Philips screw driver	5.	Spanner	9.	Gas leak detector	13. Multimeter		
2.	Level gauge	6.	Pipe cutter	10.	Measuring tape	14. Torque wrench 18 N.m (1.8 kgf.m) 42 N.m (4.2 kgf.m) 55 N.m (5.5 kgf.m)		
3.	Electric drill, hole core drill (ø70 mm)	7.	Reamer	11.	Thermometer	15. Vacuum pump		
4.	Hexagonal wrench (4 mm)	8.	Knife	12.	Megameter	16. Gauge manifold		

10.1. Safety Precautions

- Read the following "SAFETY PRECAUTIONS" carefully before installation.
- Electrical work must be installed by a licensed electrician. Be sure to use the correct rating of the power plug and main circuit for the model to be installed.
- The caution items stated here must be followed because these important contents are related to safety. The meaning of each indication used is as below. Incorrect installation due to ignoring of the instruction will cause harm or damage, and the seriousness is classified by the following indications.

• Carry out test running to confirm that no abnormality occurs after the installation. Then, explain to user the operation, care and maintenance as stated in instructions. Please remind the customer to keep the operating instructions for future reference.

1. The equipment must be earthed. It may cause electrical shock if grounding is not perfect.	
2. Do not install the unit at place where leakage of flammable gas may occur. In case gas leaks and accumulates at surrounding of the unit, it may cause fire.)
3. Carry out drainage piping as mentioned in installation instructions. If drainage is not perfect, water may enter the room and damage furniture.	the
ATTENTION	
 Selection of the installation location. Select a installation location which is rigid and strong enough to support or hold the unit, and select a location for easy maintenance).
 Power supply connection to the room air conditioner. Connect the power supply cord of the room air conditioner to the mains using one of the following method. Power supply point shall be the place where there is ease for access for the power disconnection in case of emergency. In some countries, permanent connection of this room air conditioner to the power supply is prohibited. Power supply connection to the receptacle using a power plug. Use an approved 15A/16A power plug with earth pin for the connection to the socket. 	
Power supply connection to a circuit breaker for the permanent connection. Use an approved 16A circuit breaker for the permanent connection. It must be a double pole switch with a minimum 3.5 mm contact gap.	nent
 Do not release refrigerant. Do not release refrigerant during piping work for installation, reinstallation and during repairing a refrigeration parts. Take care of the liquid refrigerant, it may cause frostbite.)
 Installation work. It may need two people to carry out the installation work. 	
5. Do not install this appliance in a laundry room or other location where water may drip from the ceiling, etc.	

10.2. Attached accessories

No.	Accessories part	Qty.	No.	Accessories part	Qty.
1	Installation plate	1	5	Remote control holder	1
2	Installation plate fixing screw	6	6	Remote control holder	2
3	Remote Control	1	7	Super alleru-buster filter	1

Applicable piping kit

CZ-4F5, 7 10AN (CS-MC12DK)

10.3. Select the best location

INDOOR UNIT

- There should not be any heat source or steam near the unit.
- There should not be any obstacles blocking the air circulation.
- A place where air circulation in the room is good.
- A place where drainage can be easily done.
- A place where noise prevention is taken into consideration.
- Do not install the unit near the door way.
- Ensure the spaces indicated by arrows from the wall, ceiling, fence or other obstacles.
- Recommended installation height for indoor unit shall be at least 2.3 m.

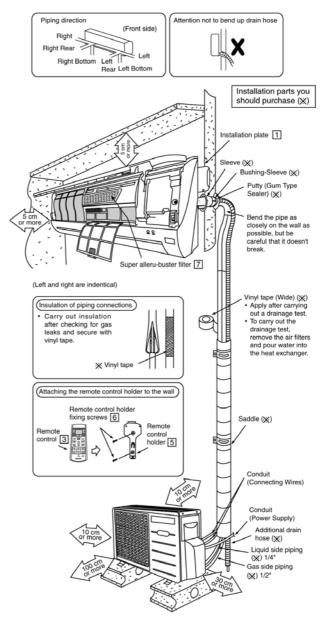

OUTDOOR UNIT

- If an awning is built over the unit to prevent direct sunlight or rain, be careful that heat radiation from the condenser is not obstructed.
- There should not be any animal or plant which could be affected by hot air discharged.
- Keep the spaces indicated by arrows from wall, ceiling, fence or other obstacles.
- Do not place any obstacles which may cause a short circuit of the discharged air.
- If piping length is over the common length, additional refrigerant should be added as shown in the table.

	Pipin	g size	Rated	Max.	Max. Piping	Additional
Model	Gas	Liquid	length (m)	Elevation (m)	Length (m)	Refrigerant (g/m)
CS-MC12DKVX2 CU-2C24DKV	1/2"	1/4"	7.5	5	15	10

The above models will be installed at a 15 m (max) distance. The refrigerant should be added 75 g.....(15-7.5) x 10 g=75 g.

10.4. Indoor/Outdoor Unit Installation Diagram

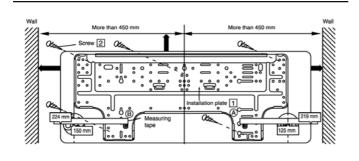

• This illustration is for explanation purposes only. The indoor unit will actually face a different way.

10.5. Indoor unit

10.5.1. SELECT THE BEST LOCATION (Refer to "Select the best location" section)

10.5.2. HOW TO FIX INSTALLATION PLATE

The mounting wall is strong and solid enough to prevent it from the vibration.

The centre of installation plate should be at more than 450 mm at right and left of the wall.

The distance from installation plate edge to ceiling should more than 67 mm.

From installation plate left edge to unit's left side is 74 mm. From installation plate right edge to unit's right is 94 mm.

- (B) : For left side piping, piping connection for liquid should be about 15 mm from this line.
 - : For left side piping, piping connection for gas should be about 45 mm from this line.
 - : For left side piping, piping connecting cable should be about 800 mm from this line.
- 1. Mount the installation plate on the wall with 5 screws or more.

(If mounting the unit on the concrete wall consider using anchor bolts.)

- Always mount the installation plate horizontally by aligning the marking-off line with the thread and using a level gauge.
- 2. Drill the piping plate hole with ø70 mm hole-core drill.
 - Line according to the left and right side of the installation plate. The meeting point of the extended line is the centre of the hole. Another method is by putting measuring tape at position as shown in the diagram above. The hole centre is obtained by measuring the distance namely 150 mm and 125 mm for left and right hole respectively.
 - Drill the piping hole at either the right or the left and the hole should be slightly slanted to the outdoor side.

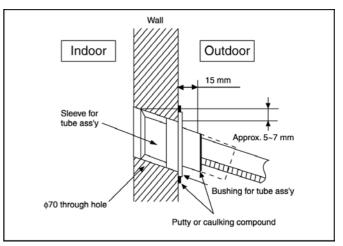

10.5.3. TO DRILL A HOLE IN THE WALL AND INSTALL A SLEEVE OF PIPING

- 1. Insert the piping sleeve to the hole.
- 2. Fix the bushing to the sleeve.
- 3. Cut the sleeve until it extrudes about 15 mm from the wall.

Caution

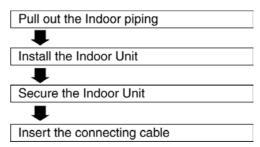

When the wall is hollow, please be sure to use the sleeve for tube ass'y to prevent dangers caused by mice biting the connecting cable.

4. Finish by sealing the sleeve with putty or caulking compound at the final stage.

10.5.4. INDOOR UNIT INSTALLATION

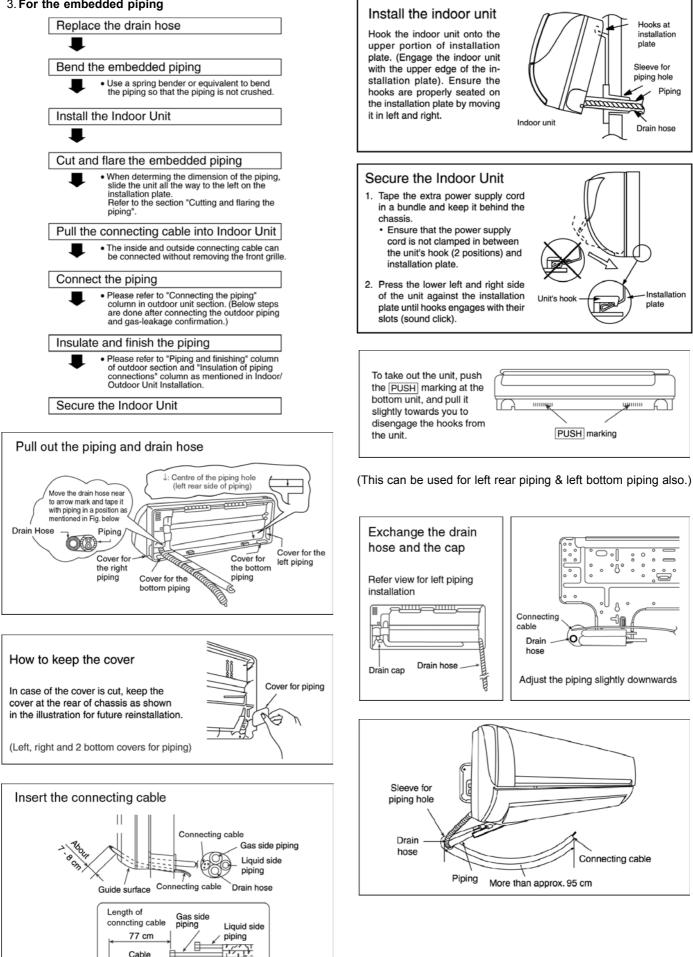

1. For the right rear piping

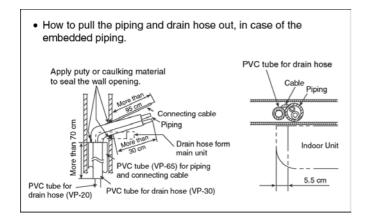

2. For the right and right bottom piping

Pull out the Indoor piping
₽
Install the Indoor Unit
₽
Insert the connecting cable
₽
Secure the Indoor Unit

3. For the embedded piping

10.5.5. CONNECT THE CABLE TO THE INDOOR UNIT

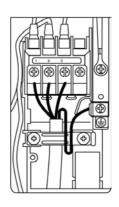

- 1. The inside and outside connecting cable can be connected without removing the front grille.
- Connecting cable between indoor unit and outdoor unit shall be approved polychloroprene sheathed 4 × 1.5 mm² flexible cord, type designation 245 IEC 57 or heavier cord.
 - Ensure the color of wires of outdoor unit and the terminal Nos. are the same to the indoor's respectively.
 - Earth lead wire shall be longer than the other lead wires as shown in the figure for the electrical safety in case of the slipping out of the cord from the anchorage.

Terminals on the indoor unit	1	2	3	Ð
Color of wires				
Terminals on the outdoor unit	1	2	3	÷

• Secure the cable onto the control board with the holder (clamper).

INSTALLATION OF SUPER ALLERU-BUSTER FILTER

- 1. Open the front panel.
- 2. Remove the air filters.
- 3. Put super alleru-buster filter (right) into place as shown in illustration at right.

. In case of left piping how to insert the connecting cable

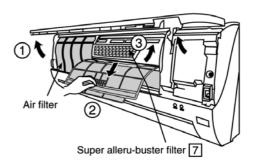

(For the right piping, follow the same procedure)

Cable

and drain hose.

Drain hose

Piping

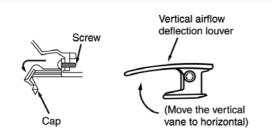

HOW TO TAKE OUT FRONT GRILLE

Please follow the steps below to take out front grille if necessary such as when servicing.

- 1. Set the vertical airflow direction louver to the horizontal position.
- 2. Slide down the 2 caps on the front grille as shown in the illustration below, and then remove the 2 mounting screws.
- 3. Pull the lower section of the front grille towards you to remove the front grille.

When reinstalling the front grille, first set the vertical airflow direction louver to the horizontal position and then carry out above steps 1 - 2 in the reverse order.

AUTO SWITCH OPERATION

The below operations will be performed by pressing the "AUTO" switch.

1. AUTO OPERATION MODE

The Auto operation will be activated immediately once the Auto Switch is pressed.

2. TEST RUN OPERATION (FOR PUMP DOWN/SERVICING PURPOSE)

The Test Run operation will be activated if the Auto Switch is pressed continuously for more than 5 sec. A "pep" sound will occur at the fifth sec., in order to identify the starting of Test Run operation

3. REMOTE CONTROLLER RECEIVING SOUND ON/OFF

The ON/OFF of Remote Controller receiving sound can be change over by the following steps:

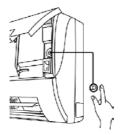

- a. Release the Auto Switch after Test Run operation is activated.
- b. Then, within 20 sec. after (a), press Auto Switch for more than 5 sec.

A "beep" "beep" sound will occur at the fifth sec., then release the Auto switch.

c. Within 20 sec. after (b), press Auto Switch again. Everytime Auto Switch is pressed (within 20 sec. interval), remote controller receiving sound status will be reversed between ON and OFF.

Long "beep" sound indicates that remote controller receiving sound is OFF.

Short "beep" sound indicates that remote controller receiving sound is ON.

10.6. Outdoor unit

10.6.1. SELECT THE BEST LOCATION (Refer to "Select the best location" section)

10.6.2. INSTALL THE OUTDOOR UNIT

- After selecting the best location, start installation according to Indoor/Outdoor Unit Installation Diagram.
- 1. Fix the unit on concrete or rigid frame firmly and horizontally by bolt nut. (ø10 mm).
- 2. When installing at roof, please consider strong wind and earthquake. Please fasten the installation stand firmly with bolt or nails.

10.6.3. CONNECTING THE PIPING

Connecting The Piping To Indoor Unit

Please make flare after inserting flare nut (locate at joint portion of tube assembly) onto the copper pipe. (In case of using long piping)

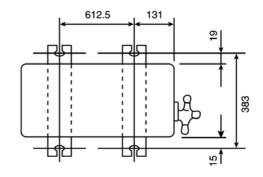

Connect the piping

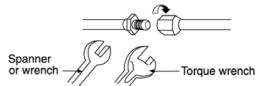

- Align the center of piping and sufficiently tighten the flare nut with fingers.
- Further tighten the flare nut with torque wrench in specified torque as stated in the table.

Connecting The Piping To Outdoor Unit

Decide piping length and then cut by using pipe cutter. Remove burrs from cut edge. Make flare after inserting the flare nut (locate at valve) onto the copper pipe.

Align center of piping to valves and then tighten with torque wrench to the specified torque as stated in the table.

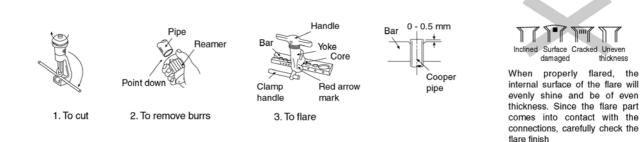

MODEL	Piping size (Torque)		
	Gas	Liquid	
CU-2C24DKV	1/2" (55 N.m)	1/4" (18 N.m)	

CUTTING AND FLARING THE PIPING

- 1. Please cut using pipe cutter and then remove the burrs.
- 2. Remove the burrs by using reamer. If burrs is not removed, gas leakage may be caused.
- Turn the piping end down to avoid the metal powder entering the pipe.
- 3. Please make flare after inserting the flare nut onto the copper pipes.

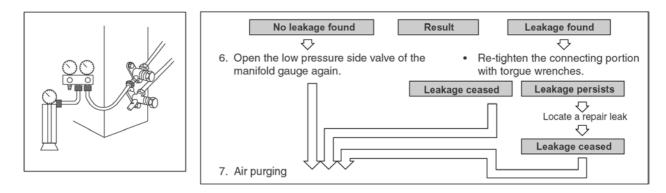

Improper flaring

flared, the

AIR PURGING OF THE PIPING AND INDOOR UNIT 10.6.4.

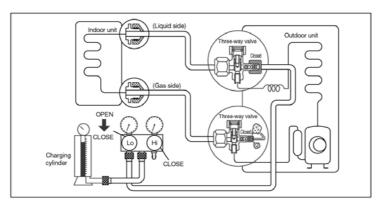

1) Checking gas leakage

- 1. Remove the service-port cap from both 3-way valves.
- 2. Connect the manifold gauge set to the service port of Liquid side 3-way valve.
- 3. Connect the charging cylinder to the manifold gauge set and open the valve of the cylinder.
- 4. Open the low pressure side valve of the manifold gauge of approx. 10 seconds and then close.
- 5. Check a gas leakage of the connecting portion of pipings with the gas-leak detector.

<For the left pipings>

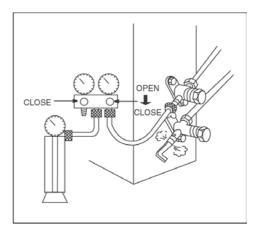

- 1. Measure the pressure.
- 2. Keep it for 5-10 minutes.
 - Ensure if the pressure indicated on the gauge is as same as that measured at first time.

2) Air purging

The air which contains remaining moisture in the refrigeration cycle may cause a malfunction on the compressor.

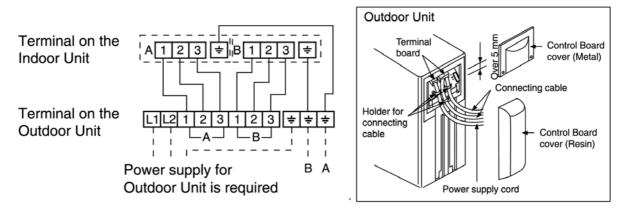

- 1. To purge the air, push the pin on the gas side 3-way valve for three seconds using with a hexagonal wrench and set it free for one minute.
 - Repeat this three times.
- 2. To balance the refrigerant, close the low pressure side valve on the manifold gauge and release a refrigerant from the piping through service port until the gauge indicates $0.49 \sim 0.294$ MPa.
- 3. Set the both 3-way valves to open position with the hexagonal wrench for the unit operation.

10.6.5. CONNECT THE CABLE TO THE OUTDOOR UNIT

- 1. Remove the control board cover from the unit by loosening the screw.
- Connecting cable between indoor unit and outdoor unit shall be approved polychloroprene sheathed flexible cord, type designation 245 IEC 57 or heavier cord (4 × 1.5 mm²).

Power supply cord cable use 3 × 1.5 mm² flexible cord, type designation 245 IEC 57 or heavier cord.

3. Secure the cable onto the control board with the holder (clamper).

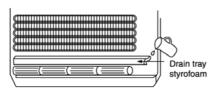

4. Attach the control board cover back to the original position with the screw.

10.6.6. PIPE INSULATION

- 1. Please carry out insulation at pipe connection portion as mentioned in Indoor/Outdoor Unit Installation Diagram. Please wrap the insulated piping end to prevent water from going inside the piping.
- 2. If drain hose or connecting piping is in the room (where dew may form), please increase the insulation by using POLY-E FOAM with thickness 6 mm or above.

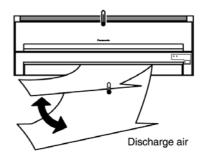

CHECK THE DRAINAGE

- Open front panel and remove air filters.
 (Drainage checking can be carried out without removing the front grille.)
- Pour a glass of water into the drain tray-styrofoam.
- Ensure that water flows out from drain hose of the indoor unit.

EVALUATION OF THE PERFORMANCE

- Operate the unit at cooling operation mode for fifteen minutes or more.
- Measure the temperature of the intake and discharge air.
- Ensure the difference between the intake temperature and the discharge is more than 8°C.

CHECK ITEMS

- Is there any gas leakage at flare nut connections?
- Has the heat insulation been carried out at flare nut connection?
- Is the connecting cable being fixed to terminal board firmly?
- Is the connecting cable being clamped firmly?
- Is the drainage OK? (Refer to "Check the drainage" section)
- Is the earth wire connection properly done?
- Is the indoor unit properly hooked to the installation plate?
- Is the power supply voltage complied with rated value?
- Is there any abnormal sound?
- Is the cooling operation normal?
- Is the thermostat operation normal?
- Is the remote control's LCD operation normal?
- Is the super alleru-buster filter is installed?

11.1. Air purging

Required tools:

Hexagonal wrench, adjustable wrench, torque wrenches, wrench to hold the joints, gas leak detector, and charging set. The air in the indoor unit and in the piping must be purged. If air remains in the refrigeration pipes, it will affect the compressor, reduce the cooling capacity, and could lead to a malfunction.

Service port cap

Be sure, using a torque wrench to tighten the service port nut (after using the service port), so that it prevents the gas leakage from the refrigeration cycle.

Procedure:

- 1. Recheck the piping connections.
- 2. Open the valve of the low pressure side of Manifold gauge counter-clockwise for 10 seconds, and then close it.
- 3. Check for gas leakage.
 - Check the flare connections for gas leakage.

4. Purge the air from the system.

- Open the Low pressure side valve of the manifold gauge.
- Press the valve core pin with the hexaganol wrench to purge the air for three seconds and then wait for one minute.
 - Repeat this three times or more.
- 5. Balance the refrigerant in the pipings and the indoor unit.
 - Close the Low pressure side valve of the manifold gauge.
 - Press the valve core pin with the hexaganol wrench to release the refrigerant until the gauge indicates.

- 6. Use torque wrench CWHAD-9211 to tighten the service port nut to a torque of 1.8 kg.cm.
- 7. Set both the 3-way valves to the open position.
- 8. Mount the valve stem nuts to the 3-way valves.
- 9. Check for gas leakage.
 - At this time, especially check for gas leakage from both the 3-way valve's stem nuts, and from the service port caps.

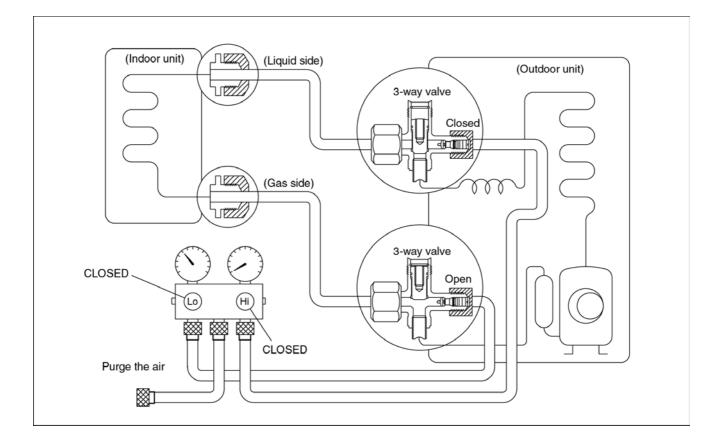

Caution

- If gas leakage is discovered in step 3 above, take the following procedures:
 - 1. Re-tighten the connecting portion with torque wrenches.

If the leakage ceases, continue the works from step 4.

2. Locate and repair the leak. (Gas leak detector) Repeat the works from step 1.

11.2. Pumping down

Procedure:

- 1. Confirm that both the 3-way valves are set to the open position.
 - Remove the valve stem caps and confirm that the valve stems are in the raised position.
 - Be sure to use a hexagonal wrench to operate the valve stems.
- 2. Operate the unit for 10 to 15 minutes.
- 3. Stop operation and wait for 3 minutes, then connect the charge set to the service port of the 3-way valves.
 - Connect the charge hose with the push pin to the gas side service port.
- 4. Air purging of the charge hose.
 - Open the low-pressure valve on the charge set slightly to purge air from the charge hose.
- 5. Set the Liquid side 3-way valve to the closed position.

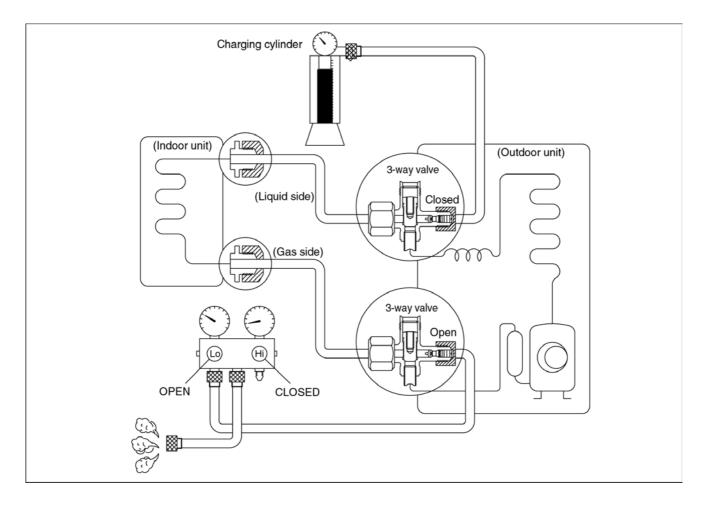

- 6. Operate the air conditioner at the cooling cycle and stop it when the gauge indicates 0 kg/cm²G.
 - If the unit cannot be operated at the cooling (weather is rather cool), press the Pump Down switch on the Indoor unit.
 - So that the unit can be operated.

7. Immediately set the 3-way valve to the closed position.

- Do this quickly so that the gauge ends up indicating 1 to 3 kg/cm²G.
- 8. Disconnect the charge set, and mount both the 3-way valve's stem nuts and the service port caps.
 - Use torque wrench CWHAD-9211 to tighten the service port nut to a torque of 1.8 N.m.
 - Be sure to check for gas leakage.

11.2.1. Re-air purging

(Re-installation)

Procedure:

- 1. Remove the cap nut from 3-way valves.
 - Remove the cap nut from 3-way valves after carefully checked whether the piping connection was properly and certainly done.
- 2. Confirm that the valve in both 3-way valves are set to the CLOSED position.
- 3. Connect the gas cylinder to the liquid-side (highpressure) 3-way valve and the charge set to the gas side (low-pressure) 3-way valve.
 - Remove the flare nut from the service port to connect the charge set and gas cylinder.
 - Close the valves on the gas cylinder and charge set.

4. Air purging.

- Open the valve on the gas cylinder.
- Open the valve on the charge set, discharge for three seconds and wait for one minute. Repeat this three times.

5. Check for gas leakage.

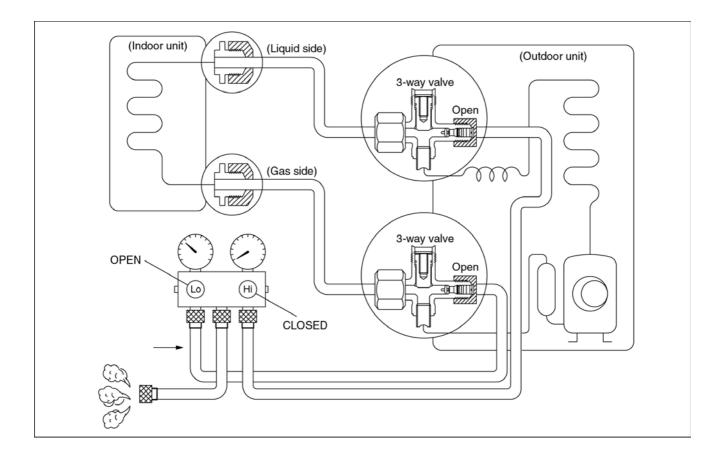

• Check the flare connections for gas leakage.

6. Discharge the refrigerant.

- Close the valve on the gas cylinder and discharge the refrigerant until the gauge indicates 3 to 5 kg/cm²G.
- 7. Disconnect the charge set and the gas cylinder.
- 8. Mount the valve stem cap nuts and the flare nuts for service port onto the 3-way valves.
- 9. Mount the cap nut and service port nut onto the 3-way valves.
 - Be sure to use a torque wrench (CWHAD-9211) to tighten the service port nut.
 - Be sure to check for gas leakage.

11.2.2. Balance refrigerant of the 3-way valves

(Gas leakage)

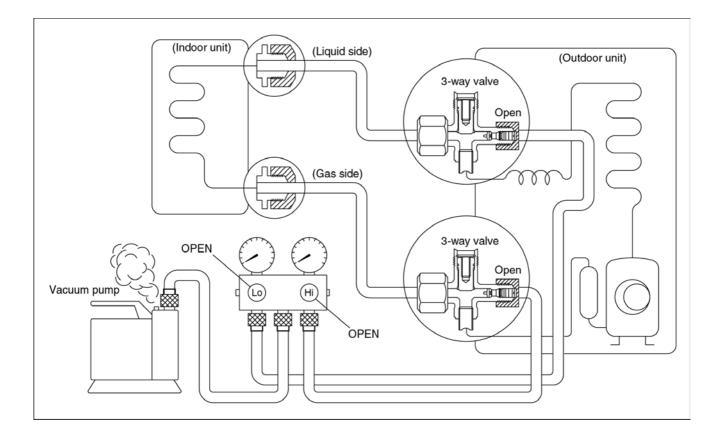

Procedure:

- 1. Confirm that both the 3-way valves are set to the open position.
- 2. Connect the charge set to the Gas side 3-way valve's port.
 - Leave the valve on the charge set closed.
 - Connect the charge hose with the push pin to the service port.
- 3. Open the valves (Lo side) on the charge set and discharge the refrigerant until the gauge indicates 0 kg/cm²G.
 - If there is no air the refrigeration cycle [the pressure when the air conditioner is not running is higher than 1 kg/cm²G], discharge the refrigerant until the gauge indicates 0.5 to 1 kg/cm²G. If this is the case, it will not be necessary to apply an evacuation.
 - Discharge the refrigerant gradually; if it is discharged too suddenly, the refrigeration oil will also be discharged.

11.3. Evacuation

(No refrigerant in the refrigeration cycle)

Procedure:

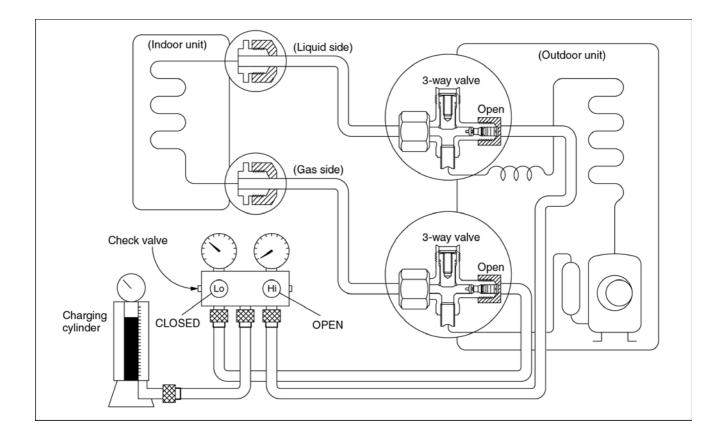

- 1. Connect the vacuum pump to the charge set's centre hose.
- 2. Evacuation for approximately one hour.
 - Confirm that the gauge needle has moved toward -76 cmHg [vacuum of 4 mmHg or less].
- 3. Close the valve (Lo side) on the charge set, turn off the vacuum pump, and confirm that the gauge needle does not move (approximately 5 minutes after turning off the vacuum pump).
- 4. Disconnect the charge hose from the vacuum pump.

• Vacuum pump oil.

If the vacuum pump oil becomes dirty or depleted, replenish as needed.

11.4. Gas charging

(After Evacuation)

Procedure:

1. Connect the charge hose to the charging cylinder.

- Connect the charge hose which you disconnected from the vacuum pump to the valve at the bottom of the cylinder.
- If you are using a gas cylinder, also use a scale and reverse the cylinder so that the system can be charged with liquid.

2. Purge the air from the charge hose.

• Open the valve at the bottom of the cylinder and press the check valve on the charge set to purge the air (Be careful of the liquid refrigerant). The procedure is the same if using a gas cylinder.

3. Open the valve (Lo side) on the charge set and charge the system with liquid refrigerant.

• If the system cannot be charged with the specified amount of refrigerant, it can be charged with a little at a time (approximately 150 g each time) while operating the air conditioner in the cooling cycle; however, one time is not sufficient, wait approximately 1 minute and then repeat the procedure. (pumping down-pin)

- 4. Immediately disconnect the charge hose from both the 3-way valve's service ports.
 - Stopping partway will allow the refrigerant to be discharged.
 - If the system has been charged with liquid refrigerant while operating the air conditioner, turn off the air conditioner before disconnecting the hose.

5. Mount the valve stem nuts and the service port caps.

- Use a torque wrench CWHAD-9211 to tighten the service port nut to a torque of 1.8 N.m.
- Be sure to check for gas leakage.

12 Servicing Information

12.1. Distinction of Lead Free (PbF) Printed Circuit Board

Printed circuit boards (manufactured) using lead free solder will have a PbF stamp on the Printed Circuit board.

CAUTION

- Pb free solder has a higher melting point than standard solder; typically the melting point is 50 70°F (30 40°C) higher. Please use a high temperature solder iron and set it to 700 ± 20°F (370 ± 10°C).
- Pb free solder will tend to splash when heated too high (about 1100° F/600°C).
- If you must use Pb solder, please completely remove all of the Pb free solder on the pin or solder area before applying Pb solder. If this is not pratical, be sure to heat the Pb free solder until it melts, before applying Pb solder.

12.2. Indoor Electronic Controllers Removal Procedures

• Electronic Controller and Display Complete unit can be seen by following the below removal procedures

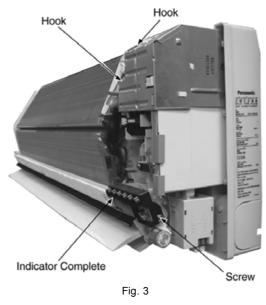

Remove 2 caps and screws

Fig. 1

 Remove the 2 caps and 2 screws at the bottom of the Front Grille. (Fig. 1)

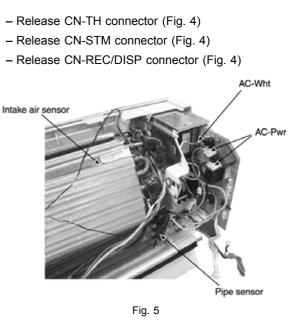

- Remove the Front Grille Complete. (Fig. 2)

- Release the taps on top and on the right side of metal plate cover. (Fig. 3)
- Then remove the metal plate cover. (Fig. 3)
- Remove the indicator complete screw, and then remove the indicator complete. (Fig. 3)

- To remove the electronic controller.
- Remove the particular piece (Fig. 4)
- Release CN-FM connector (Fig. 4)
- Release CN-FB connector (Fig. 4)
- Release CN-ION connector (Fig. 4)

- Press the hook to the right then take out the PCB(Fig. 5)
- Remove Ry-Pwr connector (black and brown) and Ac-Wht connector from the PCB. (Fig. 5)

12.3. Indoor Fan Motor and Cross Flow Fan Removal Procedures

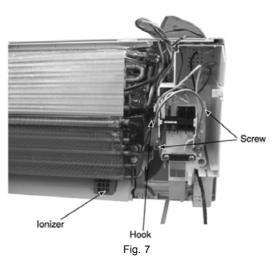

• Remove Control Board cover

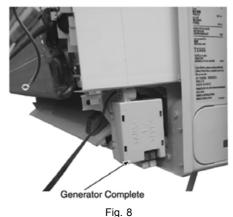

Discharge Grille Complete

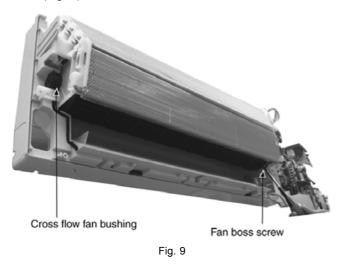

- Remove the screw on the left side of the unit. (Fig. 6)
- Pull the hook to the left and lift up the evaporator. (Fig. 6)
- Pull down the Discharge Grille Complete. (Fig. 6)

 Remove indoor pipe sensor and air intake sensor from the evaporator. (Fig. 7)

- Remove the earth wire from the evaporator (Fig. 7)
- Release the generator complete wire (green and red).
 (Fig. 8)
- Remove 2 screws on the right and 1 screw at the left side of the control board. (Fig. 7)
- Press down the hook on the left side of control board. (Fig. 7)
- Then pull out the Control Board Complete from the unit. (Fig. 7)

- Remove the cross flow fan bushing from the chassis. (Fig. 9)

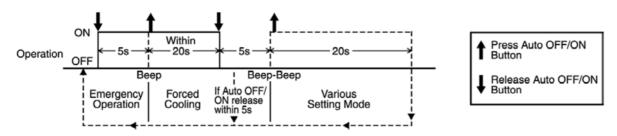

- Loosen the fan boss screw at the cross flow fan. (Fig. 9)

 Push up the evaporator and remove cross flow fan by pulling both cross flow fan and fan motor. (Fig. 10)

12.4. Auto OFF/ON Button

- The "Auto OFF/ON Button" (behind the front grille) is used to operate the air conditioner if remote control is misplaced or malfunctioning.
- Forced cooling operation is possible by pressing the "Auto OFF/ON Button" for more than 5s where "beep" sound is heard then release the button.
- User able to select remote control transmission code and toggle remote control signal receiving sound under various setting mode.
- To enter various setting mode:
 - Press the "Auto OFF/ON Button" continuosly for 5s (beep sound is heard) and release.
 - Within 20s, press the "Auto OFF/ON Button" continuously for 5s again (2 beep sound is heard) and release.
 - Various setting mode has limit up to 20s. Then return to normal operation.

12.4.1. Toggle Remote Control Signal Receiving Sound

- Under various setting mode, press the "Auto OFF/ON Button" to toggle the remote control sound.
 - Short "beep" : Turn ON remote control signal receiving sound.
 - Long "beep" : Turn OFF remote control signal receiving sound.
- After "Auto OFF/ON Button" is pressed, the 20s counter for various setting mode is restarted.

12.4.2. Remote Control Transmission Code

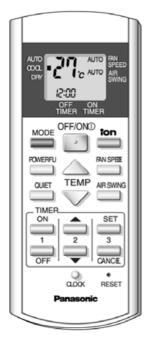

- There are 4 type of remote control transmission code could be selected and stored in EEPROM of indoor unit. The indoor unit will only operate when received signal with same transmission code from remote control. This could prevent signal inteference when there are 2 or more indoor unit installed nearby together.
- To change remote control transmission code, short or open jumpers at the remote control printed circuit board.

Remote Control Printed Circuit Board	Transmission Code Combination			
Remote Control Finited Circuit Board	J - A	J - B	Remote Control No.	
400 (A)	Short	Open	A (Default)	
	Open	Open	В	
	Short	Short	С	
	Open	Short	D	

- Under various setting mode, after select the transmission code combination of remote control, press any button of remote control to transmit a signal to indoor unit. The transmission code will be stored in EEPROM.
- After signal is received, the various setting mode is cancelled and return to normal operation.

12.5. Remote Control Reset

- When the batteries are inserted for the first time or the batteries are replaced, you may notice the indications at remote control's display screen blink continuosly and not functionable. If this condition happens, try to reset the remote control by pushing the reset terminal with a pointing device.
- You may also do the reset to erase the setting at remote control and restore back the default setting.

13 Troubleshooting Guide

13.1. Refrigeration cycle system

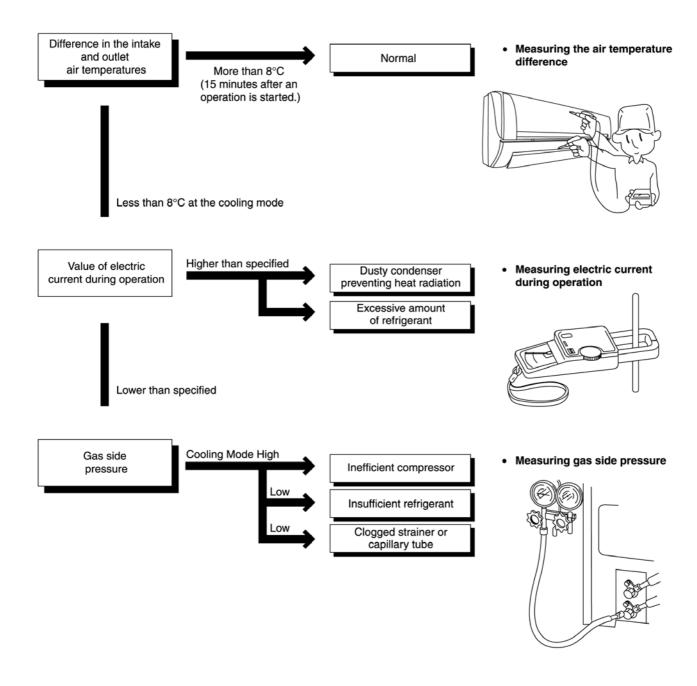

In order to diagnose malfunctions, make sure that there are no electrical problems before inspecting the refrigeration cycle. Such problems include insufficient insulation, problem with the power source, malfunction of a compressor and a fan.

The normal outlet air temperature and pressure of the refrigeration cycle depends on various conditions, the standard values for them are shown in the table to the right.

Normal Pressure and Outlet Air Temperature (Standard)

	Gas pressure Mpa (kg/cm²G)	Outlet air temperature (°C)
Cooling Mode	0.4 ~ 0.6 (4 ~ 6)	12 ~ 16

* Condition: Indoor fan speed; High Outdoor temperature: 35°C

13.2. Relationship between the condition of the air conditioner and pressure and electric current

		Cooling Mode					
Condition of the air conditioner	Low Pressure	High Pressure	Electric current during operation				
Insufficient refrigerant (gas leakage)	*	1	1				
Clogged capillary tube or Strainer	ogged capillary tube or Strainer		be or		*		
Short circuit in the indoor unit	1	1	1				
Heat radiation deficiency of the outdoor unit	-	-	-				
Inefficient compression		1	1				

• Carry out the measurements of pressure, electric current, and temperature fifteen minutes after an operation is started.

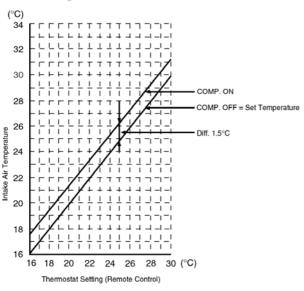

13.3. Diagnosis methods of a malfunction of a compressor

Nature of fault	Symptom
Insufficient compressing of a compressor	 Electric current during operation becomes approximately 20% lower than the normal value. The discharge tube of the compressor becomes abnormally hot (normally 70 to 90°C). The difference between high pressure and low pressure becomes almost zero.
Locked compressor	 Electric current reaches a high level abnormally, and the value exceeds the limit of an ammeter. In some cases, a breaker turns off. The compressor has a humming sound.
